Description essay Draft

In the field I am intrigued the most in is one of the video games. Video games have always interested me, ever since I was young that's why video games are very important in my life as they have been with me since my childhood. My father was the one who bought me my first gaming system, which was the Gameboy color . It was a clear system that was purple and he bought me Pokémon Red as my first game. As a child I didn't know what I was really doing in the game, but over time I learned how to play the game and completed it. The joy of completing a game that you have been working on for days to weeks as a kid is an amazing feeling. So that feeling drove me to continue playing games on different systems such as the PlayStation and Nintendo 64. As the years went on, online gaming was introduced into most new systems which allows you to play with different players all around the world. With this feature added, I could make friends in Japan, Germany, Canada, and different states in the United States. Certain games also require players to play in unison with each other to complete tasks which helps build trust and reliability between them.

My favorite type of video games now is puzzle games because they pose challenges that require thought to complete. If I were to recommend any games for people who would like to begin playing games, I would recommend Brain Age. Brain Age is a collection of games that are designed to help people of all ages keep their mind active. Some of the games included are memory tests where you must remember sequences like Simon says. Another type of game that is included is a math one that helps you solve problems faster and faster mentally.

Overall video games are a major part of the world whether you play them or don't play them.

Some games help children learn, while other games help people create bonds through space and time. Also, Video games are responsible for making kids familiar with technology. They are also responsible for developing mathematical and engineering skills in your mind. Most games encourage you to move to the next level and earn more scores in order to win or survive the game. This factor works positively amongst people. They learn a lot of things like calculations quickly and also develop a attitude to move forward to achieve goals in life.
